

System for Stereoscopic Viewing of an Image

Abstract of Disclosure

A system for stereoscopic viewing of an image, comprising displaying upon a generally flat surface a conventional stereoscopic pair of images, with the images proximate but separate from one another. The system includes an optical device adapted to be placed in front of a viewer's eyes, in which the optical axis for at least one eye is re-angled, so that each eye generally targets the center of a respective one of the pair of images.
